IT MANAGER / GARMENT MANUFACTURING

CURIOUS BY NATURE. **IT** BY CHOICE.

I'm Min Hein Zaw, IT Manager for two garment factories in Myanmar. I look after the infrastructure and business systems that keep people and production moving, and I love making technology work.

INFRASTRUCTURE • SECURITY & BACKUP • MICROSOFT 365 • BUSINESS SYSTEMS • AUTOMATION

EXPERTISE

What I look after.

01
Infrastructure
SERVERS · ESXI · NETWORK · CCTV

02
Security & Backup
BACKUPS · ACCOUNTS · ACCESS

03
Microsoft 365
EXCHANGE · SHAREPOINT · LICENCES

04
Business Systems
ERP · PAYROLL · PLANNING · UAT

05
Automation
POWER AUTOMATE · N8N · AI

PHILOSOPHY

IT should make the workday more dependable.

In manufacturing, a network, system or information problem is never only technical. It can stop a line, delay a shipment or leave a team without what it needs to decide.

FEATURED CASE STUDIES

Real problems, worked through.

SYSTEMS IMPLEMENTATION 01

From UAT Findings to a Successful Visitor Management Rollout

Factory testing showed the group's new visitor system did not yet fit how visitors are handled on site, so it could not go live as it was.

SYSTEM REVIEW AND DECISION 02

Turning Production Feedback into a Better IT Decision

A group production tracking system did not fit our two Myanmar factories: teams entered data every day but got little back, and both factories asked to stop using it.

HOW I WORK

Six stages, from the floor up.

01 UNDERSTAND → 02 DEFINE → 03 STABILIZE → 04 DELIVER → 05 VALIDATE → 06 IMPROVE

Let's build better systems.

IT SYSTEMS THAT KEEP PRODUCTION MOVING.

MYANMAR / GARMENT MANUFACTURING

Case studies · Desktop 1280 px · /case-studies/

CASE STUDIES

Real problems from factory operations, and how I worked through them.

Selected real-world IT case studies from manufacturing operations. Each one follows the same path, from the business problem to the outcome.

PROBLEM → CONTEXT → MY ROLE → DECISION → ACTION → OUTCOME

FEATURED CASE STUDIES

SYSTEMS IMPLEMENTATION 01

From UAT Findings to a Successful Visitor Management Rollout

IT Manager · May – Aug 2026

`In use at 2 Myanmar factories` `Interim register for about a month` `Interim retired`

BUSINESS PROBLEM

Factory testing showed the group's new visitor system did not yet fit how visitors are handled on site, so it could not go live as it was.

MY ROLE

Factory-side coordinator: ran UAT, turned user feedback into change requests, and kept visitor registration running with a temporary Microsoft 365 register.

OUTCOME

The improved system is in use at both Myanmar factories, and the temporary register has been retired.

Read case study →

SYSTEM REVIEW AND DECISION 02

Turning Production Feedback into a Better IT Decision

IT Manager · Implementation / Feb – Oct 2026

`Group system for 8 factories` `2 Myanmar factories affected` `Rebuild in progress`

BUSINESS PROBLEM

A group production tracking system did not fit our two Myanmar factories: teams entered data every day but got little back, and both factories asked to stop using it.

MY ROLE

The link between production teams, the group's overseas IT team and the developers: gathered feedback, explained the gaps and reported to the Director.

OUTCOME

A stop-or-rebuild discussion led to a rebuild that is now close to going back into use.

Read case study →

MORE CASE STUDIES

INFRASTRUCTURE 03

Building a New Factory's IT from the Ground Up

IT Assistant (IT support) · About 6 months · 2017 – 2018

`~20 users` `2 servers` `~70 CCTV cameras` `~6 months`

BUSINESS PROBLEM

A new garment factory needed working IT before its first users arrived, while the building was still under construction.

MY ROLE

IT support, doing most of the work myself: cabling, network, two servers, CCTV, PCs and laptops.

OUTCOME

IT ready for around 20 users, with 2 servers and around 70 CCTV cameras, after about six months.

Read case study →

BACKUP AND RECOVERY 04

Backup and Recovery After a Ransomware Scare

IT Executive · 2021 – present

`4 servers` `Daily ERP & Payroll backups` `Servers back in 1 day after fire`

BUSINESS PROBLEM

Ransomware in 2021 left some user data unrecoverable and showed that a server failure could stop operations.

MY ROLE

Set up and ran a 3-2-1 backup routine for the ERP, Payroll and file servers, and tested restores.

OUTCOME

Restores proven; after a 2023 fire, the servers were back in use within one full day.

Read case study →

IT OPERATIONS 05

Covering a Second Factory When Its IT Team Left

IT Executive · About 3 months · 2023

`100+ users on site` `~60 users remote` `~3 months`

BUSINESS PROBLEM

The IT staff at the group's second factory all left with no handover, leaving more than 100 users without support.

MY ROLE

Supported that factory on site while supporting my own factory remotely, for about three months.

OUTCOME

Both factories kept their IT support, and I was appointed IT Executive for both.

VISITOR MANAGEMENT SYSTEM

From UAT Findings to a Successful Visitor Management Rollout

How factory feedback, iterative improvements and an interim Microsoft 365 solution helped move a visitor management system into successful operation across our Myanmar factories.

ROLE	TIMELINE	ENVIRONMENT
IT Manager	**May – Aug 2026**	**Manufacturing / factory operations**

FOCUS

`UAT` `Requirements` `User coordination` `Implementation` `Business continuity`

TECHNOLOGIES `INTERIM SOLUTION ONLY`

`Microsoft 365` `Microsoft Forms` `Power Automate` `SharePoint`

Factory UAT findings and requirements fed into the improvement of the main visitor system.

The improved system was validated and is in use at both Myanmar factories.

The interim Microsoft 365 register was retired once the main system was operational.

Executive summary

The group's Visitor Management System (VMS) needed significant changes after testing on the factory side showed gaps between what the system did and how our factories actually work. I coordinated user feedback and requirements between the factories and the development team. While the changes were made, I set up a temporary visitor register on Microsoft 365 so that visitor registration kept running. Once the main VMS had been improved and validated, it went into use at both Myanmar factories, and the temporary solution was retired.

Business context

Visitor management is an everyday operational process in a factory: people arrive, are registered, and the person they are visiting needs to know and approve the visit. The group IT team developed a VMS for the factories in which visitors check in at a kiosk and the host approves the visit.

The challenge was not whether the software worked in a technical sense, but whether it fitted the real workflow at our factories. A system that does not match how people work tends to be bypassed, so operational fit had to be confirmed before rollout.

My role

I worked on the Myanmar factory side, as the link between the people who would use the system and the team building it.

Factory users
↕
IT — my role
↕
Development team

- **Coordination:** worked with users at the factory to understand how visitors are actually handled.
- **User acceptance testing:** ran UAT with factory users and observed where the system did not fit daily work.
- **Requirements:** collected feedback, identified practical issues and consolidated them into clear change requests.
- **Communication:** passed the requirements to the development team and followed them through.
- **Business continuity:** set up an interim visitor register on Microsoft 365 while the changes were made.
- **Validation and adoption:** re-tested the improved system and supported users through rollout.

Project journey

01 **Initial VMS**
Group system developed for factory visitor management.

02 **Factory UAT**
Tested with factory users against real daily workflows.

03 **Operational gaps identified**
The system needed many changes before it could support factory operations.

04 **Requirements & change requests**
Feedback consolidated and sent to the development team.

05 **Interim Microsoft 365 solution** `TEMPORARY`
Kept visitor registration running for about a month during the changes.

06 **Main VMS improvements**
The development team made the requested changes.

07 **Re-testing & validation**
The improved system was checked against factory needs again.

08 **Myanmar factory rollout**
The improved VMS went into use at both Myanmar factories.

09 **Interim solution retired**
The temporary register was removed once it was no longer needed.

UAT & requirements

Factory-side testing was used to find the gaps between what the system offered and what daily operations required. The aim was to confirm operational fit, not only that each feature technically worked.

`01 TEST → 02 OBSERVE → 03 COLLECT FEEDBACK → 04 CONSOLIDATE REQUIREMENTS →`
`05 COMMUNICATE CHANGES → 06 RE-VALIDATE`

Feedback from users was grouped into clear requirements before it went to the development team, so that each change request described a real operational need.

Interim business continuity solution

While the main VMS was being improved, visitor registration still had to work. I set up a temporary visitor register using the Microsoft 365 tools the company already had.

`TEMPORARY / INTERIM SOLUTION`

Visitor / user Enters visit details → **Microsoft Forms** Collects the registration → **Power Automate** Processes each entry → **SharePoint list** Stores the visitor record → **Email notification** Informs the people concerned

This was always intended as a bridge to keep operations running, not as a replacement for the main system.

Decision & transition

The goal was never to run two competing systems. The Microsoft 365 register supported operations for about a month. Once the main VMS had been improved, tested and was working at both Myanmar factories, the temporary solution was no longer needed and was retired.

Primary VMS
UAT findings
Improvements in progress

+

Microsoft 365 register `TEMPORARY`
Business continuity, about one month

↓

Improved primary VMS
Validated and operational at both Myanmar factories

↓

~~Microsoft 365 interim solution~~
Retired

Final outcome

- Factory feedback and requirements became part of the improvement cycle for the main VMS.
- The main VMS was improved through multiple changes.
- The improved system became suitable for, and is used at, both Myanmar factories.
- The temporary Microsoft 365 register was retired after the main VMS became operational.
- The project moved from testing and operational gaps to a usable long-term visitor management system.

What this project demonstrates

UAT	Requirements analysis	Business-IT alignment	Stakeholder coordination
Change management	Business continuity	Microsoft 365	Power Automate
SharePoint	Implementation	Validation	User adoption

Lessons learned

- **Test for operational fit.** UAT should confirm that a system fits the way people work, not only that its features function.
- **User feedback improves implementation.** Clear, consolidated feedback from the factory floor shaped a better system.
- **Temporary solutions protect continuity.** A short-term tool can keep operations running without becoming permanent technical debt.
- **Retire the bridge on time.** When the right long-term solution is ready, the temporary one should be removed.
- **Decide for sustainable value.** Technology decisions should favour what the operation can rely on long term.

> The goal is not to keep every solution we build. The goal is to keep the business running while moving toward the right long-term solution.

Technology works best when it fits the operation.

PROJECTS

What I built, what I coordinated, what I'm learning.

Every project says who built it and what my part was. Systems built by the group's developers or bought from vendors are marked as coordinated, not as my own work.

01 / BUILT AT WORK

Tools I built for the factories.

I built these myself, for use at work.

BUILT BY ME

PRODUCTION

Fabric Age Control dashboard

TECHNOLOGY Excel · SharePoint · Power Automate

PROBLEM

Fabric should not sit in the warehouse for years; when an order comes in, older rolls should be used first.

MY CONTRIBUTION

Built a dashboard that tracks each fabric's age from the day it arrives. Used every day in the warehouse.

02 / IMPLEMENTED OR COORDINATED

Systems I helped bring into use.

Built by the group's developers or bought from vendors. My part was requirements, UAT, coordination and rollout support, not development.

GROUP SYSTEM

IMPLEMENTED

Visitor Management System

Built by the group's in-house development team

PROBLEM

Factory testing showed the new visitor system did not yet fit how visitors are handled on site.

MY CONTRIBUTION

Led factory-side UAT, gathered requirements and feedback, coordinated changes with the developers and supported rollout. In use at both Myanmar factories.

View case study →

GROUP SYSTEM · REBUILD

IN PROGRESS

Production Tracking System

Built by the group's in-house development team

PROBLEM

The group system did not fit our two Myanmar factories, and production teams got little back from it.

MY CONTRIBUTION

Gathered production feedback, explained the gaps to the developers, reported to the Director, and now support the rebuild.

View case study →

VENDOR SYSTEM · SOLVEI8

IN PROGRESS

Plani8

Bought from Solvei8

PURPOSE

Production planning.

MY CONTRIBUTION

Project coordination for the roll-out. Tracki8 and Maintaini8 are planned next, once Plani8 is stable.

VENDOR SYSTEM · DATAMATION

IN PROGRESS

FINAC Payroll

Bought from Datamation

PURPOSE

Payroll, to replace the current in-house payroll system.

MY CONTRIBUTION

Project coordination: data and requirements gathering.

03 / LEARNING BUILDS

Where I try new tools.

Personal prototypes and experiments. Not production systems.

LEARNING BUILD · PROTOTYPE

LEARNING

Style Control Workbook & live dashboard

TECHNOLOGY Excel · SharePoint · Power Automate

LEARNING

How to follow one order through every production department, from merchandising to delivery, in one place.

MY CONTRIBUTION

Building a prototype workbook with a live dashboard. In progress.

LEARNING BUILD · EXPERIMENT

LEARNING

Hourly production automation

TECHNOLOGY n8n · Telegram · AI · SharePoint

LEARNING

Exploring workflow automation with n8n and AI.

MY CONTRIBUTION

Experiment: hourly production updates sent on Telegram are read by an AI step in n8n and written to a SharePoint Excel file. In progress.

04 / RETIRED

Done its job.

Solutions that were needed for a time and then removed.

INTERIM · BUILT BY ME

RETIRED

Visitor register on Microsoft 365

TECHNOLOGY Microsoft Forms · Power Automate · SharePoint

PROBLEM

Visitor registration had to keep running while the main visitor system was being improved.

MY CONTRIBUTION

Built a temporary business-continuity register that collected visits and notified the right people. Retired once the improved main system was in use.

IT SYSTEMS THAT KEEP PRODUCTION MOVING.

MYANMAR / GARMENT MANUFACTURING

START A CONVERSATION↗

About · Desktop 1280 px · /about/

MHZ. MIN HEIN ZAW
IT MANAGER

Home About Projects Case Studies Process Contact ◐

ABOUT

The work I would choose every time.

IT has held my interest since I was young, and solving an IT problem still gives me the same curiosity it did then. Today I manage IT for two garment factories in Myanmar, with more than 15 years of hands-on experience behind me.

Min Hein Zaw

IT Manager · Garment manufacturing

IN IT	15+ years
SITES	2 factories
BASED IN	Myanmar

01 / MY PATH

What shaped the way I work

2010 - 2017 **IT Staff, Myanmar Police Organization**
Running servers, networks and CCTV showed me how much people depend on reliable systems, and on clear communication.

2017 - 2018 **IT Assistant (IT support), garment factory**
Setting up a new factory's IT from the construction stage taught me how the whole system fits together. It was also my first ERP roll-out.

2018 - 2019 **Personal Assistant to the Managing Director**
I moved closer to management on purpose, to see how decisions and operations connect. Then I returned to IT, the work I enjoy most.

2019 - TODAY **IT Executive, then IT Manager**
From technical operations to managing IT for two factories, while learning how the supply chain works and where IT can help.

02 / HOW I WORK

Between the business and the technology

Most of my work is translation: understanding what the factory needs, and making sure the people who build or supply systems understand it too.

Business & factory users
Every production department, from merchandising to delivery, and management

⇄ NEEDS FEEDBACK

IT — my role
Translate, coordinate, keep things running

⇄ REQUIREMENTS TESTING

Developers & vendors
The group's IT team and outside vendors

How I approach a problem

01 **Go to the floor**
Talk with the people who do the work, in meetings and during testing.

02 **Understand the process**
Follow how the work flows from one team to the next before changing anything.

03 **Turn needs into requirements**
Group feedback into clear change requests for developers, vendors or the group IT team.

04 **Keep operations running**
If the main system is not ready, put a simple bridge in place, and retire it later.

05 **Validate and report**
Re-test with users, and give management a clear summary to decide on.

See the full process →

03 / WHAT I BELIEVE

Three things I hold on to

Technology has to fit the operation.
If it works technically but not on the factory floor, people will work around it.
Visitor system case study ↗

Requirements start at ground level.
Know who will use it, and how it helps production, before anything is built.
Production tracking case study ↗

Keep the business running.
Use a simple bridge when needed, and retire it when the right solution is ready.
Visitor system case study ↗

04 / BEYOND THE JOB

Teaching and learning

Why I teach

I built my IT path the hard way, with little money. Since 2018 I have taught Microsoft Office, PageMaker and Photoshop part-time, to make that path easier for people who start where I did.

What I'm exploring now

AI-assisted workflows, automation and business systems for more digital operations. I try them in my **learning builds** first, not in production, while studying for a Higher Diploma in Computer Science and the CCNA.

05 / FULL CV

Experience, systems, skills, education and languages

PROCESS

What happens when a problem lands on my desk.

Six stages I follow on factory IT and business-system work. They come from doing the work, not from a textbook, and each one links to a real case.

01 UNDERSTAND → 02 DEFINE → 03 STABILIZE → 04 DELIVER → 05 VALIDATE → 06 IMPROVE

THE SIX STAGES

01 Understand

Start with the business problem, not the technology.

- Go to the floor and watch the work as it happens.
- Talk with the people who do it, in meetings and during testing.
- Follow how work moves from one team to the next.

IN PRACTICE

Production team meetings showed why a tracking system gave them little back.
Production tracking case study →

02 Define

Turn what I saw into something people can act on.

- Requirements and clear change requests.
- Constraints, risks and who is responsible for what.
- What success looks like for the operation.

IN PRACTICE

Factory feedback grouped into change requests for the developers. **Visitor system case study →**

03 Stabilize

Keep the operation running while the real fix is prepared.

- Find a safe temporary workaround.
- Keep interruption to daily work as small as possible.
- Plan from the start how the workaround will be removed.

IN PRACTICE

A temporary Microsoft 365 register kept visitor registration running for about a month.
Visitor system case study →

04 Deliver

Coordinate the people and the work.

- Coordinate developers, vendors and the group IT team.
- Configuration, data preparation and testing.
- Training and go-live support for users.

IN PRACTICE

A new factory's cabling, network and servers, fitted around construction.
Factory IT set-up case study →

05 Validate

Does it work for the operation, not only technically?

- Test with real users and real workflows.
- Re-test after every round of changes.
- Give management a clear summary to decide on.

IN PRACTICE

Factory-side UAT found the gaps before the system went live. **Visitor system case study →**

06 Improve

Delivery is not the end of the work.

- Collect feedback and document what was done.
- Monitor, back up, and test that restores work.
- Automate where it helps; retire temporary solutions.

IN PRACTICE

Daily backups with tested restores; the temporary visitor register retired.
Backup and recovery case study →

HOW I DECIDE

When deciding on a solution, I ask:

01 Does it fit the operation?
02 Can users work with it?
03 Is it secure enough for its purpose?
04 Can IT support it?
05 What happens when it fails?
06 Can it be maintained?
07 Is temporary complexity becoming permanent?

See the stages in real work.

VISITOR MANAGEMENT SYSTEM

From UAT Findings to a Successful Visitor Management Rollout

How factory feedback, iterative improvements and an interim Microsoft 365 solution helped move a visitor management system into successful operation across our Myanmar factories.

ROLE
IT Manager

TIMELINE
May – Aug 2026

ENVIRONMENT
Manufacturing / factory operations

FOCUS
`UAT` `Requirements` `User coordination` `Implementation` `Business continuity`

TECHNOLOGIES `INTERIM SOLUTION ONLY`
`Microsoft 365` `Microsoft Forms` `Power Automate` `SharePoint`

Factory UAT findings and requirements fed into the improvement of the main visitor system.

The improved system was validated and is in use at both Myanmar factories.

The interim Microsoft 365 register was retired once the main system was operational.

Executive summary

The group's Visitor Management System (VMS) needed significant changes after testing on the factory side showed gaps between what the system did and how our factories actually work. I coordinated user feedback and requirements between the factories and the development team. While the changes were made, I set up a temporary visitor register on Microsoft 365 so that visitor registration kept running. Once the main VMS had been improved and validated, it went into use at both Myanmar factories, and the temporary solution was retired.

Business context

Visitor management is an everyday operational process in a factory: people arrive, are registered, and the person they are visiting needs to know and approve the visit. The group IT team developed a VMS for the factories in which visitors check in at a kiosk and the host approves the visit.

The challenge was not whether the software worked in a technical sense, but whether it fitted the real workflow at our factories. A system that does not match how people work tends to be bypassed, so operational fit had to be confirmed before rollout.

My role

I worked on the Myanmar factory side, as the link between the people who would use the system and the team building it.

- **Communication:** passed the requirements to the development team and followed them through.
- **Business continuity:** set up an interim visitor register on Microsoft 365 while the changes were made.
- **Validation and adoption:** re-tested the improved system and supported users through rollout.

Project journey

01 **Initial VMS**
Group system developed for factory visitor management.

02 **Factory UAT**
Tested with factory users against real daily workflows.

03 **Operational gaps identified**
The system needed many changes before it could support factory operations.

04 **Requirements & change requests**
Feedback consolidated and sent to the development team.

05 **Interim Microsoft 365 solution**
TEMPORARY
Kept visitor registration running for about a month during the changes.

06 **Main VMS improvements**
The development team made the requested changes.

07 **Re-testing & validation**
The improved system was checked against factory needs again.

08 **Myanmar factory rollout**
The improved VMS went into use at both Myanmar factories.

09 **Interim solution retired**
The temporary register was removed once it was no longer needed.

UAT & requirements

Factory-side testing was used to find the gaps between what the system offered and what daily operations required. The aim was to confirm operational fit, not only that each feature technically worked.

01 TEST
02 OBSERVE
03 COLLECT FEEDBACK
04 CONSOLIDATE REQUIREMENTS
05 COMMUNICATE CHANGES
06 RE-VALIDATE

Feedback from users was grouped into clear requirements before it went to the development team, so that each change request described a real operational need.

Interim business continuity solution

While the main VMS was being improved, visitor registration still had to work. I set up a temporary visitor register using the Microsoft 365 tools the company already had.

TEMPORARY / INTERIM SOLUTION

Visitor / user
Enters visit details
↓
Microsoft Forms
Collects the registration
↓
Power Automate
Processes each entry
↓
SharePoint list
Stores the visitor record
↓
Email notification
Informs the people concerned

This was always intended as a bridge to keep operations running, not as a replacement for the main system.

Decision & transition

The goal was never to run two competing systems. The Microsoft 365 register supported operations for about a month. Once the main VMS had been improved, tested and was working at both Myanmar factories, the temporary solution was no longer needed and was retired.

Primary VMS
UAT findings
Improvements in progress

+

Microsoft 365 register TEMPORARY
Business continuity, about one month

↓

Improved primary VMS
Validated and operational at both Myanmar factories

↓

~~**Microsoft 365 interim solution**~~
Retired

Final outcome

- Factory feedback and requirements became part of the improvement cycle for the main VMS.
- The main VMS was improved through multiple changes.
- The improved system became suitable for, and is used at, both Myanmar factories.
- The temporary Microsoft 365 register was retired after the main VMS became operational.
- The project moved from testing and operational gaps to a usable long-term visitor management system.

What this project demonstrates

UAT
Requirements analysis
Business–IT alignment
Stakeholder coordination
Change management
Business continuity
Microsoft 365
Power Automate
SharePoint
Implementation
Validation
User adoption

Lessons learned

- **Test for operational fit.** UAT should confirm that a system fits the way people work, not only that its features function.
- **User feedback improves implementation.** Clear, consolidated feedback from the factory floor shaped a better system.
- **Temporary solutions protect continuity.** A short-term tool can keep operations running without becoming permanent technical debt.
- **Retire the bridge on time.** When the right

VISITOR MANAGEMENT SYSTEM

From UAT Findings to a Successful Visitor Management Rollout

How factory feedback, iterative improvements and an interim Microsoft 365 solution helped move a visitor management system into successful operation across our Myanmar factories.

ROLE
IT Manager

TIMELINE

Projects · Mobile 390 px · /projects/

PROJECTS

What I built, what I coordinated, what I'm learning.

Every project says who built it and what my part was. Systems built by the group's developers or bought from vendors are marked as coordinated, not as my own work.

01 / BUILT AT WORK

Tools I built for the factories.

I built these myself, for use at work.

BUILT BY ME PRODUCTION

Fabric Age Control dashboard

TECHNOLOGY Excel · SharePoint · Power Automate

PROBLEM
Fabric should not sit in the warehouse for years; when an order comes in, older rolls should be used first.

MY CONTRIBUTION
Built a dashboard that tracks each fabric's age from the day it arrives. Used every day in the warehouse.

02 / IMPLEMENTED OR COORDINATED

Systems I helped bring into use.

Built by the group's developers or bought from vendors. My part was requirements, UAT, coordination and rollout support, not development.

GROUP SYSTEM IMPLEMENTED

Visitor Management System

Built by the group's in-house development team

PROBLEM
Factory testing showed the new visitor system did not yet fit how visitors are handled on site.

MY CONTRIBUTION
Led factory-side UAT, gathered requirements and feedback, coordinated changes with the developers and supported rollout. In use at both Myanmar factories.

View case study →

GROUP SYSTEM · REBUILD IN PROGRESS

Production Tracking System

Built by the group's in-house development team

PROBLEM
The group system did not fit our two Myanmar factories, and production teams got little back from it.

MY CONTRIBUTION
Gathered production feedback, explained the gaps to the developers, reported to the Director, and now support the rebuild.

View case study →

VENDOR SYSTEM · SOLVEI8 IN PROGRESS

Plani8

Bought from Solvei8

PURPOSE
Production planning.

MY CONTRIBUTION
Project coordination for the roll-out. Tracki8 and Maintaini8 are planned next, once Plani8 is stable.

VENDOR SYSTEM · DATAMATION IN PROGRESS

FINAC Payroll

Bought from Datamation

PURPOSE
Payroll, to replace the current in-house payroll system.

MY CONTRIBUTION
Project coordination: data and requirements gathering.

03 / LEARNING BUILDS

Where I try new tools.

Personal prototypes and experiments. Not production systems.

LEARNING BUILD · PROTOTYPE LEARNING

Style Control Workbook & live dashboard

TECHNOLOGY Excel · SharePoint · Power Automate

LEARNING
How to follow one order through every production department, from merchandising to delivery, in one place.

MY CONTRIBUTION
Building a prototype workbook with a live dashboard. In progress.

LEARNING BUILD · EXPERIMENT LEARNING

Hourly production automation

TECHNOLOGY n8n · Telegram · AI · SharePoint

LEARNING
Exploring workflow automation with n8n and AI.

MY CONTRIBUTION
Experiment: hourly production updates sent on Telegram are read by an AI step in n8n and written to a SharePoint Excel file. In progress.

04 / RETIRED

Done its job.

Solutions that were needed for a time and then removed.

INTERIM · BUILT BY ME RETIRED

Visitor register on Microsoft 365

TECHNOLOGY Microsoft Forms · Power Automate · SharePoint

PROBLEM
Visitor registration had to keep running while the main visitor system was being improved.

MY CONTRIBUTION
Built a temporary business-continuity register that collected visits and notified the right people. Retired once the improved main system was in use.

About · Mobile 390 px · /about/

MHZ. MIN HEIN ZAW
IT MANAGER

ABOUT

The work I would choose every time.

IT has held my interest since I was young, and solving an IT problem still gives me the same curiosity it did then. Today I manage IT for two garment factories in Myanmar, with more than 15 years of hands-on experience behind me.

Min Hein Zaw

IT Manager · Garment manufacturing

IN IT	15+ years
SITES	2 factories
BASED IN	Myanmar

01 / MY PATH

What shaped the way I work

2010 - 2017

IT Staff, Myanmar Police Organization

Running servers, networks and CCTV showed me how much people depend on reliable systems, and on clear communication.

2017 - 2018

IT Assistant (IT support), garment factory

Setting up a new factory's IT from the construction stage taught me how the whole system fits together. It was also my first ERP roll-out.

2018 - 2019

Personal Assistant to the Managing Director

I moved closer to management on purpose, to see how decisions and operations connect. Then I returned to IT, the work I enjoy most.

2019 - TODAY

IT Executive, then IT Manager

From technical operations to managing IT for two factories, while learning how the supply chain works and where IT can help.

02 / HOW I WORK

Between the business and the technology

Most of my work is translation: understanding what the factory needs, and making sure the people who build or supply systems understand it too.

Business & factory users
Every production department, from merchandising to delivery, and management

⇅ NEEDS · FEEDBACK

IT — my role
Translate, coordinate, keep things running

⇅ REQUIREMENTS · TESTING

Developers & vendors
The group's IT team and outside vendors

How I approach a problem

01 **Go to the floor**
Talk with the people who do the work, in meetings and during testing.

02 **Understand the process**
Follow how the work flows from one team to the next before changing anything.

03 **Turn needs into requirements**
Group feedback into clear change requests for developers, vendors or the group IT team.

04 **Keep operations running**
If the main system is not ready, put a simple bridge in place, and retire it later.

05 **Validate and report**
Re-test with users, and give management a clear summary to decide on.

---

03 / WHAT I BELIEVE

Three things I hold on to

Technology has to fit the operation.

If it works technically but not on the factory floor, people will work around it.

Visitor system case study ↗

Requirements start at ground level.

Know who will use it, and how it helps production, before anything is built.

Production tracking case study ↗

Keep the business running.

Use a simple bridge when needed, and retire it when the right solution is ready.

Visitor system case study ↗

---

04 / BEYOND THE JOB

Teaching and learning

Why I teach

I built my IT path the hard way, with little money. Since 2018 I have taught Microsoft Office, PageMaker and Photoshop part-time, to make that path easier for people who start where I did.

What I'm exploring now

AI-assisted workflows, automation and business systems for more digital operations. I try them in my **learning builds** first, not in production, while studying for a Higher Diploma in Computer Science and the CCNA.

Process · Mobile 390 px · /process/

PROCESS

What happens when a problem lands on my desk.

Six stages I follow on factory IT and business-system work. They come from doing the work, not from a textbook, and each one links to a real case.

01 UNDERSTAND
↓
02 DEFINE
↓
03 STABILIZE
↓
04 DELIVER
↓
05 VALIDATE
↓
06 IMPROVE

THE SIX STAGES

01 Understand

Start with the business problem, not the technology.

- Go to the floor and watch the work as it happens.
- Talk with the people who do it, in meetings and during testing.
- Follow how work moves from one team to the next.

IN PRACTICE

Production team meetings showed why a tracking system gave them little back.
Production tracking case study →

02 Define

Turn what I saw into something people can act on.

- Requirements and clear change requests.
- Constraints, risks and who is responsible for what.
- What success looks like for the operation.

IN PRACTICE

Factory feedback grouped into change requests for the developers. **Visitor system case study →**

03 Stabilize

Keep the operation running while the real fix is prepared.

- Find a safe temporary workaround.
- Keep interruption to daily work as small as possible.
- Plan from the start how the workaround will be removed.

IN PRACTICE

A temporary Microsoft 365 register kept visitor registration running for about a month.
Visitor system case study →

04 Deliver

Coordinate the people and the work.

- Coordinate developers, vendors and the group IT team.
- Configuration, data preparation and testing.
- Training and go-live support for users.

IN PRACTICE

A new factory's cabling, network and servers, fitted around construction.
Factory IT set-up case study →

05 Validate

Does it work for the operation, not only technically?

- Test with real users and real workflows.
- Re-test after every round of changes.
- Give management a clear summary to decide on.

IN PRACTICE

Factory-side UAT found the gaps before the system went live. **Visitor system case study →**

06 Improve

Delivery is not the end of the work.

- Collect feedback and document what was done.
- Monitor, back up, and test that restores work.
- Automate where it helps; retire temporary solutions.

IN PRACTICE

Daily backups with tested restores; the temporary visitor register retired.
Backup and recovery case study →

HOW I DECIDE

When deciding on a solution, I ask:

01 Does it fit the operation?

02 Can users work with it?

03 Is it secure enough for its purpose?

04 Can IT support it?

05 What happens when it fails?

06 Can it be maintained?

07 Is temporary complexity becoming permanent?

See the stages in real work.
